

IDN Visual Security Deep Thinking

xisigr
Feb,2019

About me

- Security researcher of Tencent's Xuanwu Lab
 - <https://xlab.tencent.com>
- Author of Web Front-End Hacker's Handbook
 - <https://www.web2hack.org/>
- xisigr@Xeye team
- twitter.com/xisigr , weibo.com/xisigr

Internationalized Domain Names (IDNs)

- IDNs
 - Long time ago, domains could only consist of the Latin letters A to Z, digits, and a few other characters from the US-ASCII coded character set.
 - IDNs allow characters from the Universal Character Set Unicode since 2003.
 - In 2018, Unicode 11.0 contains a repertoire of 137374 characters covering 146 modern and historic scripts.
 - In these more than 10 years, IDNs visual confusion security issues has never been interrupted.
 - What do IDNs Mean to you?

ASCII Domain names vs. Internationalized Domain Names (IDNs)

nm	NM	$\frac{3}{4}$ $\frac{1}{4}$ $\frac{2}{3}$ $\frac{1}{3}$ $\frac{1}{2}$
		$\frac{1}{2}$ % = \$!
		; : . .

Please read description.

Thinking

IDN TLD

- Until late 2009, TLDs were restricted to only the Latin letters a to z . After 2009, IDN TLDs were introduced in other scripts.
 - 58 IDN ccTLDs evaluated representing 40 countries/territories
 - 56 IDN ccTLDs delegated representing 38 countries/territories
 - Requests cover 33 languages in 19 scripts
- gTLD
 - com, org, net, edu, gov, mil.....
 - شبكة(网络), онлайн(在线), グーグル(谷歌), 游戏.....(IDN gTLD)
- ccTLD
 - cn, jp, nz, hr, be, cc.....
 - موريتانيا(毛里塔尼亚), 新加坡, 한국(韩国), سودان(苏丹).....(IDN ccTLD)

IDN Country Code Top-Level Domains

Think about it

- IDN TLD has been around for ten years (2009-2019). With the emergence and increasing of IDN TLD, What changes to IDN visual security?
- Whether Emoji is allowed in IDN or in IDN TLD?

Domain Name Registration Process

domain registry process

<https://whois.icann.org/en/domain-name-registration-process>

Think about it

- In the whole domain name registration process, which links are relatively weak will help us to hunt IDN spoof.

IDNs Registration Rules

- gTLD
 - .COM .NET
 - https://www.verisign.com/en_US/channel-resources/domain-registry-products/idn/idn-policy/registration-rules/index.xhtml
 -
 -
- ccTLD
 - السعودية.(Saudi Arabia.)
 - http://www.nic.sa/en/view/writing_arabic_idn_guideline
 - Association's Hebrew IDN rules
 - https://www.isoc.org.il/files/docs/ISOC-IL_Registration_Rules_v1.5_ENGLISH_-_26.6.2016.pdf
 -
 -

.COM IDNs Registration Rules

- 1. IETF Standards
 - Compliance with all of the RFC that comprise the IDNA2008 standard.
- 2. Restrictions on Specific Languages
 - All IDN registrations require a 3 letter Language Tag.
- 3. Restrictions On Commingling Of Scripts
 - All code points within an IDN must come from the same Unicode script
 -
- 4. ICANN' s Restricted Unicode Points
 -
- 5. Special Characters
 -

Unicode Scripts And Associated Code Points

Arabic	Georgian	Latin	Rejang
Armenian	Glagolitic	Lepcha	Runic
Avestan	Greek	Limbu	Samaritan
Balinese	Gujarati	Lisu	Saurashtra
Bamum	Gurmukhi	Lycian	Sinhala
Batak	Han	Lydian	Sundanese
Bengali	Hangul	Malayalam	Syloti Nagri
Bopomofo	Hanunoo	Mandaic	Syriac
Brahmi	Hebrew	Meetei Mayek	Tagalog
Buginese	Hiragana	Mongolian	Tagbanwa
Buhid	Imperial Aramaic	Myanmar	Tai Le
Canadian Aboriginal	Inscriptional Pahlavi	New Tai Lue	Tai Tham
Carian	Inscriptional Parthian	Nko	Tai Viet
Cham	Javanese	Ogham	Tamil
Cherokee	Kaithi	Ol Chiki	Telugu
Coptic	Kannada	Old Persian	Thaana
Cuneiform	Katakana	Old South Arabian	Thai
Cyrillic	Kayah Li	Old Turkic	Tibetan
Devanagari	Kharoshthi	Oriya	Tifinagh
Egyptian Hieroglyphs	Khmer	Phags Pa	Vai
Ethiopic	Lao	Phoenician	Yi

Think about it

- How many IDN rules are there in the world ?
- How do we find IDN Spoof under these rules?

Continue Thinking

Unicode Visual Security Issues

Grapheme Rendering

- Inadequate Rendering
 - An additional problem arises when a font or rendering engine has inadequate support for characters or sequences of characters.
- Quick Example

String	UTF-16	Punycode
e!.com	<u>0065</u> _006C <u>0323</u> _002E 0063 006F 006D	xn--e-zom.com
el.com	<u>0065 0323</u> _006C 002E 0063 006F 006D	xn--l-ewm.com
el.com	<u>1EB9</u> _006C 002E 0063 006F 006D	xn--l-ewm.com

CVE-2018-4124

① telugu sign virama (U+0C1C)

⑤ telugu vowel sign aa (U+0C3E)

② telugu sign virama (U+0C4D)

④ zero width non-joiner (U+200C)

③ telugu letter nya (U+0C1E)

Glyphs in Complex Scripts

Mixed-Script

- Mixed-Script Spoofing
 - The characters in some scripts, though different in meaning, are usually identical or nearly identical in appearance. However, the existence of visually confusable characters across scripts offers numerous opportunities for spoofing.
- Quick Example

String	UTF-16	Punycode
top.com	0074 <u>03BF</u> 0070 002E 0063 006F 006D	xn--tp-jbc.com
top.com	0074 <u>006F</u> 0070 002E 0063 006F 006D	top.com

Punycode

- PunyCode Spoofing
 - Punycode is a special encoding used to convert Unicode characters to ASCII, which is used to encode internationalized domain names (IDN). The Punycode transformation is relatively dense. That means that it is fairly likely that arbitrary words after the "xn--" will result in valid labels.
- Quick Example
 - URL: <http://www.google.com>
 - PunyCode URL: <http://xn--google.com>

Bidirectional Text

- Bidirectional Text Spoofing
 - When characters are mixed with left-to-right text(LTR) and right-to-left text(RTL), Unicode Bidirectional Algorithm will use a precise set of rules to determine the final visual rendering. However, presented with arbitrary sequences of text, this may lead to text sequences which may be impossible to read intelligibly, or which may be visually confusable.
- Quick Example
 - Access to `http://127.0.0.1/%D8%A7/example.org`
 - In address bar, maybe visual rendering `http://example.org/١/127.0.0.1`

LTR vs RTL

- URL-LTR

- Subdomain: hi
- Domain: google
- TLD: com
- Path: search

- <http://hi.google.com/search>

- URL-RTL(hebrew)

- Subdomain: ה
- Domain: ג
- TLD: ל
- Path: מ

- 渲染 : <http://מ/ל.ג.ה>

Combining Mark

- Combining mark spoofing
 - Combining mark are characters that are intended to modify other characters. Combining character sequence maybe become visually indistinguishable with other characters .
- Quick Example
 - google◌.com
 - ◌ = U+18A9

Firefox/Chrome

Safari/Edge

Think about it

- How to resolve RTL Spoof in address bar?
- Only show origin?
 - showing only the origin reduces utility, though. That's for the UX designers to decide.
 - Either way, it doesn't fully resolve these issues. You can still do RTL spoofs with just the origin (like having the labels shown out-of-order).
 - Some error logic.
 - Eg: "www" or "m" subdomain is removed
 - <https://bugs.chromium.org/p/chromium/issues/detail?id=881694>
- Spoofable RTL URLs in the UI
 - <https://bugs.chromium.org/p/chromium/issues/detail?id=351639>

Think about it

- Should combination character sequence be supported to register?
- Is it possible to strictly check and prevent such malicious intentions at the Registrar stage?
- Think about these questions in the URL, you may find something new.
 - http://unicode.org/faq/char_combmark.html.
